FACILITY: COPY

ABSTRACT:

This utility program creates a copy of one or more user-specified files. Two or more files may optionally be concatenated to create a single output file.

ENVIRONMENT:

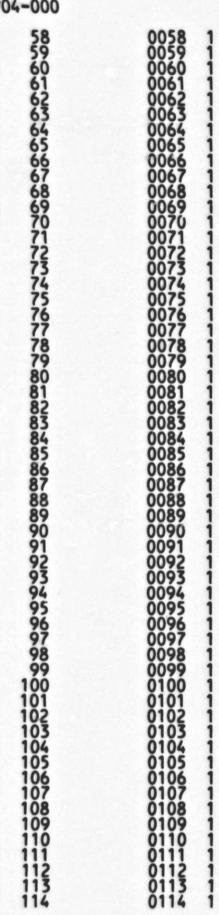

AUTHOR: Ward Clark, CREATION DATE: 19 August 1977

Modified by:

V03-014 TSK0015 Tamar Krichevsky 26-Jul-1984
Use the constant 32 for the multi-block count, instead of the system multi-block count.

V03-013 TSK0014 Tamar Krichevsky 9-jun-1984
Avoid an access violation by have BYPASS_CONCAT return a value.
If this value is true, then stop processing. If it is false, then continue copying files.

V03-012 TSK0013 Tamar Krichevsky 8-May-1984
Rearrange the calls to CLI\$GET_VALUE and LIB\$FIND_FILE so that a command such as COPY a.a,a.a,a.a,a.a NL: will copy every file, instead of every other file.

- V03-011 TSK0012 Tamar Krichevsky 25-Apr-1984
 Add a check, after trying to open the output file, to be sure that if the current operation is an APPEND and the output file was not found, then processing should stop. No use appending to a non-existant file.
- V03-010 TSK0011 Tamar Krichevsky 17-Mar-1984
 Add a missing ".", so that the correct files are opened when the input file has a wildcard in it's specification. Copy the resultant file file name from LIB\$FIND_FILE into the input file's NAM block and IN_NAME_DESC. Otherwise, the confirm prompt, log messages and error reporting would use the wrong information.
- V03-009 TSK0010 Tamar Krichevsky 27-Feb-1984
 Replace COPY's scheme for allocating I/O buffer pool (The I/O buffer pool is area in which COPY maintains its user buffers for RMS calls.) The old scheme allocated virtual memory for the I/O buffer pool based on the processes working set size. The new scheme alloates enough virtual memory to hold the largest record or block transfer instead.

Convert input file parse and searching to LIB\$FIND_FILE.

- V03-008 TSK0009 Tamar Krichevsky 15-Feb-1984

 Fix RMS_SETUP so that the incompatible attributes message is not issued when the input or the output device is network.
- V03-007 TSK0008 Tamar Krichevsky 3-Oct-1983

 fix RMS_SETUP so that the incompatible attributes message is not issued when the input device is a unit record device. The input and output devices have to be the same kind of devices and be file structured before the information in the file header can be compared.
- V03-006 TSK0007 Tamar Krichevsky 6-Sep-1983 fix an Access violation introduced in V30-005. This time wild card copy operations didn't work.
- V03-005 TSK0006 Tamar Krichevsky 1-Sep-1983
 Fix access violation introduced in V30-004. Append operations didn't work.
- V03-004 TSK0005 Tamar Krichevsky 29-Aug-1983
 Modify how the output file's XAB chain is reinitialized at the end of COPY\$COPY. This change has been made so that COPY adheres to the new philosophy about the propogation of file protection and revision dates.
- V03-003 TSK0004 Tamar Krichevsky 23-Jan-1983 Replace the command language interface with the new CLI.

Add COPY\$CHECK_FILE_FOR_MATCH routine which calls LIB\$QUAL_FILE_MATCH to see if the input file should be copuied to the output file.

V03-003 TSK0003

Tamar Krichevsky

29-Mar-1982

Allow /NOTRUNCATE to work for non-contiguous sequential files by correcting the If statement in COPY\$CALC_ALQ which decides if the output file will be truncated or the same size as the input file. Previously, non-contiguous sequential files were always being truncated, even if /NOTRUNCATE was specified. Now, if /NOTRUNCATE is given, the allocation of the input file is used for the output file.

- V03-002 TSK0002 Tamar Krichevsky 22-Mar-1982 Correct logic in IF statement which forces record mode I/O in RMS_SETUP. Record mode copies to a foreign disk were being attempted instead of block mode.
- V03-001 TSK0001 Tamar Krichevsky 16-Mar-1982 Force record mode operations if input and output devices are both magtape and one is ANSI while the other is mounted foreign.
- V021 WMC032 Wayne Cardoza 22-Dec-1981 Don't allow copy of a directory as a file. Let the [] be displayed in mag tape log messages.
- V020 WMC026 Wayne Cardoza 10-Dec-1981 fix incorrect ordering of PARSE. fix log messages for network devices.
- V019 WMC003 Wayne Cardoza 17-Nov-1981 Quit when operator aborts a mount request.
- V018 WMC002 Wayne Cardoza 02-Nov-1981
 Don't try to create directories on record devices.
 Make sure directory created in correct directory.
 Don't print directory name for non-directory devices.
- V017 TMH0017 Tim Halvorsen 06-Sep-1981 Do not issue 'N files created' if the number of files created is only one.
- X0016 KRM0007 Karl Malik 11-Feb-1981 Modified COPY\$COPY to not attempt to create a directory when the output is a network device. Instead, issue a MSG\$_NOTCREDIR (new) warning message and continue.
- X0015 KRM0005 Karl Malik 14-Jan-1981
 Init the block_count and record_count in CREATE DIR so as not to use the previous value. Also, modified REPORT_NAMES to issue a "created" message when a subdirectory is created (rather than a "copied" message).
- X0014 LMK0001 Len Kawell 27-Mar-1980 Correct computation of USZ and MBC for record mode.
- X0013 TMH0012 Tim Halvorsen 31-Jan-1980
 Do not use LRL as the USZ for record mode I/O as the LRL can sometimes be incorrect when appending files together with differing LRL's. COPY should be fixed sometime in

the future to make the LRL on a concatenated file correct. JAKO012

J. Krycka 07-Dec-1979
Set ASY bit in ROP after \$CONNECT when doing block I/O to x0012

avoid having to issue a \$WAIT after the connect. This is necessary for network block I/O because a network \$CONNECT actually causes DAP messages to be exchanged and thus does not complete immediately.

X00011 TMH0011 19-Dec-1979 T. Halvorsen Do not create a directory on the output side for magtapes.

TMH0010 T. Halvorsen 17-Nov-1979
Add GLOBAL ROUTINE msg_number from its own module to this module to avoid conflict with require file of the X00010 TMH0010 same name in the update procedure. It had one modification: T. Halvorsen 15-Nov-1979 Do not add in COPY/APPEND facility unless high-order word is non-zero.

X00009 TMH0009 24-0ct-1979 T. Halvorsen If input file is a directory file, then either create a directory on the output side or do nothing depending on whether the directory already exists or not.

16-Aug-1979 X00008 T. Halvorsen Move fixed overhead to here from COPY.REQ and increase it by another 10 to avoid copy from magtape wsl problems

X00007 T. Halvorsen 30-Jul-1979 Make RMS_SETUP fill the UBF/USZ fields for all device types due to a change in RMS which causes move mode to always be used (locate mode had some timing windows).

X00006 T. Halvorsen 21-Jul-1979 Remove 60 second timeout from input RAB

X00005 T. Halvorsen 14-Jul-1979 Detect insufficient working set size to avoid "internal logic error" message when allocating negative amount of storage.

JAK0004 J. Krycka 16-Mar-1978 15:00 To support file append over the network, omit 'incompatible attributes' check if NET bit is set. X00004

JAK0003 J. Krycka 16-Mar-1978 14:30 To support copy of files in VFC format over the network, put RHB address in both input and output RABs if NET bit is set. X00003

01

18-04-78 C. Peters Change INCLUDE file declarations to suit VMS native compiles.
Remove SHR\$_HASHCONCAT, SHR\$_INCOMPAT literals.
18-04-78 C. Peters Change COPY to reflect modified behavior.
Include COPY.REQ. Delete LITERAL definitions for general use, status flags. Delete macro definitions for commonly used status flags.
Rename COPY_STATUS to COPY\$CLI_STATUS.

Don't include RMSMAC.L32, STARDE.L32. Include STARLET.L32 from SYS\$LIBRARY.

Delete external (iteral declarations of RMS status codes, They are in STARLET.L32 too.

Delete GLOBAL variable COPY\$CLI STATUS. Put it in a new module, COPYGBL.B32.

Instead of calling GET_OUTFILE, call COPY\$GET_OUTFIL, in COPYSPECS.

Delete GET OUTFILE

Instead of calling GET_INFILE, call COPY\$OPN_INFILE, in COPYSPECS.

Delete GET_INFILE from this module.

Instead of calling OPEN_INFILE, call COPY\$OPN_INFILE, in COPYSPECS.

Delete OPEN_INFILE.

Rename IN OPEN_ERROR to COPY\$INDON ERR: OUT_OPEN_ERROR to COPY\$OUTOPN_ERR;

CLOSE_OUTFILE to COPY\$CLOSE_OUTF.

Instead of calling OPEN_OUTFILE, call COPY\$OPN_OUTFIL, in COPYSPECS.

Rename OUT CLOSE_ERROR to COPY\$CLOSE_OUTF.

Remove declaration for STS\$K INFO. Put this in COPY.REQ.

Remove declaration for STS\$K INFO. Put this in COPY.REQ.

Remove declaration for VMSMAC.L32, put it in COPY.REQ.

Rename CALCULATE_ALG to COPY\$GALC_ALQ and make it a global routine.

Rename CALCULATE_ALG to COPY\$GALC_ALQ and make it a global routine.

Rename CLI_RESOLT to COPY\$GALC_ALQ and make it a global routine.

Rename CLI_RESOLT to COPY\$GALC_ALQ and make it a global in COPYGBL.

In main routine, close output file is flag MULTIPLE_OUTPUT is set, instead of testing for the CONCAT_FOLLOWS flag being not set.

Move setting of CONCAT_GUAL and NOCONCAT_GUAL into the routine GET_CMD GUAL.

Move OUTFILE_OPEN and APPEND COMMAND bits into COPY\$SEM_STATUS from COPY\$CLI_STATUS.

Remove RMS declarations for input file descriptions to file called fILINPUT.B32.

Remove RMS declarations for input file descriptions to file called fILINPUT.B32.

Remove RMS declarations for input file descriptions to file called fILINPUT.B32.

Remove CRIS declarations for input file descriptions to file called fILINPUT.B32.

Remove RMS declarations for input file descriptions to file called fILINPUT.B32.

Remove RMS declarations for input file descriptions to file called fILINPUT.B32.

Remove RMS declarations for output file descriptions to file c for this output file. In RMS_SETUP, when setting the MBC and MBF fields for a record mode copy, set the MBC field to the size of the input file only the size is less than or equal to 127 blocks. Otherwise, MBC goes negative.

In RMS_SETUP, a record mode copy from disk or tape loads RAB\$W_USZ from XAB\$W_LRL if non-zero; otherwise, FAB\$W_BLS.

DETAILED FUNCTIONAL DESCRIPTION:

This utility program creates a copy of one or more user-specified files. These files can be explicitly named or can be referred to through use of RMS wildcard file naming. Two or more files may optionally be concatenated to create a single output file.

All file I/O is done using standard RMS facilities. Therefore, the input and output files can exist on any device supported by RMS, including devices at remote network nodes. If possible, file copying is done using block I/O. Record I/O is used only when an input or output file is record oriented (e.g., terminal, unit record) or when a concatenated file is being copied.

This utility is intended to interface directly with a Command Language Interpreter (CLI) and cannot be directly invoked from Command Language level or from an executing program. Numerous command options (i.e., qualifiers) are supported to allow the Command Language user to (1) optionally specify the location and attributes of the input and output files, and (2) control the reporting of each file copy.

If more than one copy operation is specified in a single COPY request, each file copy is performed independent of the others. Therefore, the failure of one file copy operation (e.g., I/O error, input file not found) does not affect the remaining copy requests. The single exception to this rule is that unprocessed concatenated input files are bypassed in the event of a file copy failure.

NOTE: This module contains some temporary code that (1) circumvents a system problem or (2) cannot be implemented until an expected system function is available. In some cases, codes have been added; in other cases, code has been "commented out". In either case, each statement affected includes a comment of the form "!#n", where "n" is a number from the following table:

#1 - symbol not currently defined in STARLET.L32
#2 - I/O buffers cannot be locked in working set - known restriction
#3 - MODIFY does not accept FHC XAB - future feature

qualifier_active(global_qual, local_qual, locally_negated) =
 (IF (.global_qual AND NOT .locally_negated) OR .local_qual
 THEN true
 ELSE false)%

GLOBAL ROUTINE COPYSCHECK_FILE_FOR_MATCH =
FUNCTIONAL DESCRIPTION:
                                         This routine sets up the parameters for and calls LIB$QUAL_FILE_MATCH to see if the input
                                         file matches the criteria given on the command line.
                                FORMAL PARAMETERS:
                                         None
                                 IMPLICIT INPUTS:
                                        IN_NAME_DESC : Input file name descriptor
OUT_NAME_DESC : Output file name descriptor
OUTFILE_OPEN : Output file is currently open
COMMON_QUAL_CONTEXT : Common qualifier data area
                                 IMPLICIT OUTPUTS:
                                         None
                                ROUTINE VALUE:
                                         Whatever LIB$QUAL_FILE_MATCH returns.
                                COMPLETION CODES:
                                         None
                                SIDE EFFECTS:

GLOBAL ROUTINE COPYSCALC_ALQ = ! Allocation quantity calculation routine FUNCTIONAL DESCRIPTION: This routine determines the output file allocation/extension quantity. FORMAL PARAMETERS: None IMPLICIT INPUTS: IMPLICIT OUTPUTS: None ROUTINE VALUE: Size of the input file (i.e., number of blocks) SIDE EFFECTS: None

BEGIN

LOCAL ALQ:

! Temporary allocation quantity

Return a zero allocation size if the output file is not a disk and it is being extended.

IF .EXTEND_OUTFILE AND
(NOT .OUTFILE_FAB[\$FAB_DEV(FOD)] OR
.OUTFILE_FAB[\$FAB_DEV(SQD)]) THEN RETURN 0:

If the output file is being extended and it is not a file structured device or it is a magnetic tape,

return a zero allocation size to the caller.

Determine the output file allocation size from the size and organization of the input file.

; Routine Size: 129 bytes, Routine Base: \$CODE\$ + 0790

signal "file appended" with the following argument

Number of message arguments Address of input file name descriptor Address of output file name descriptor

PUT_MESSAGE (MSG\$_APPENDEDB,

IN NAME DESC.

GLOBAL ROUTINE COPYSINOPN_ERR (
                                                                        ! RMS input open error action routine ! Address of associated FAB or RAB
                    FAB_RAB_ADDRESS )
                    : NOVALUE =
  FUNCTIONAL DESCRIPTION:
          This RMS error action routine sends an input open error message to the user.
  FORMAL PARAMETERS:
          FAB_RAB_ADDRESS.ra.v - Address of the associated FAB or RAB
  IMPLICIT INPUTS:
          Input file name block
Input file name after open
Input file name before open
          Input file cli descriptor
  IMPLICIT OUTPUTS:
          None
  ROUTINE VALUE:
          None
  SIDE EFFECTS:
          None
    BEGIN
         FAB_RAB = .FAB_RAB_ADDRESS : BLOCK[,BYTE]; ! Redefine routine parameter.
    LOCAL
         MESSAGE_ID,
NAM_BLK : REF $BBLOCK[],
NAME_DESC : VECTOR[2];
                                                                          Local message identifier
Pointer to NAM block
                                                                          Input file name descriptor
  Fillin the file name descriptor with the most complete name possible.
     NAM_BLK = .FAB_RAB[FAB$L_NAM];
     IF .NAM_BLK[NAM$B_RSL] NEQ 0 THEN
                                                                          If a resultant name string exists,

! RMS output open error action routine ! Address of associated FAB or RAB

FUNCTIONAL DESCRIPTION:

This RMS error action routine sends an output open error message to the user.

FORMAL PARAMETERS:

FAB_RAB_ADDRESS.ra.v - Address of the associated FAB or RAB

IMPLICIT INPUTS:

OUTFILE_NAM_BLK - Output file name block
OUTFILE_NAME - Output file name after open
OUTFILE_XNAME - Output file name before open
OUTFILE_DESC - Output file request descriptor

IMPLICIT OUTPUTS:

FAB_RAB = .FAB_RAB_ADDRESS : BLOCK[,BYTE]; ! Redefine routine parameter.

MESSAGE_ID, NAME_DESC : VECTOR[2];

! Local message identifier ! Output file name descriptor

fillin the file name descriptor with the most complete name possible.

IF .OUTFILE_NAM_BLK[NAM\$B_RSL] NEQ 0

MESSAGE ID = MSG\$ OPENOUT; NAME_DESC[0] = .OUTFILE NAM_BLK[NAM\$B_RSL]; NAME_DESC[1] = OUTFILE_NAME; END

ELSE

IF .OUTFILE_NAM_BLK[NAM\$B_ESL] NEQ 0

! If a resultant name string exists,

indicate an open error and fillin the resultant name length ! and address.

! If RMS created an expanded string but couldn't ope

GLOBAL ROUTINE COPYSMSG_NUMBER ( MSG_ID ) =
                                                                             ! COPY/APPEND me:
! Message number
                                                                                COPY/APPEND message number generator
  FUNCTIONAL DESCRIPTION:
          This routine return a COPY-specific or APPEND-specific message id by inserting the appropriate facility identifier in the high word of the message id which is passed by the caller. This routine also records the highest severity message encountered.
  FORMAL PARAMETERS:
           MSG_ID.rlu.v - Message id
  IMPLICIT INPUTS:
           APPEND_COMMAND = APPEND command indicator
           MOST_SEVERE_ERR - Current most severe error id OUTFILE_NAM_BLK - Output file name block - wildcard indicator
  IMPLICIT OUTPUTS:
          MOST_SEVERE_ERR - Most severe error id may be updated
  ROUTINE VALUE:
           Actual message id
  SIDE EFFECTS:
           None
     BEGIN
           MSG_ID : BLOCK[,BYTE];
                                                                             ! Redefine the form of the input argument
     LOCAL
           ACTUAL_MSG_ID : BLOCK[1];
                                                                             ! Actual message identifier
  Calculate the actual message identifier.
IF .MSG_ID<16,16> EQL 0 THEN
                                                                             ! If facility unspecified,
      IF .APPEND_COMMAND
                                                                             ! If this is an APPEND command,
                                                                             insert the APPEND facility code into the message i
If this is a COPY command.
insert the COPY facility code into the message id.
           ACTUAL_MSG_ID = .MSG_ID + (APPEND_ID * 65536)
           ACTUAL_MSG_ID = .MSG_ID + (COPY_ID * 65536)
     ACTUAL_MSG_ID = .MSG_ID;
                                                                             ! else use existing code
